do they produce even the least oscillation.

2 If the lungs of a dead animal be
~~not~~ filled with air, and a pressure
 afterwards made upon the throat,
 a sound is emitted from the glottis,
 not unlike that which ~~is~~ was
 natural to the same animal in its

living state. Now no one can suppose
 the organs of the voice to be in a tense state in a dead
 animal. ^{exciting}

3 If the voice depended upon ~~position~~
 tremulous motions upon tense cords,
 there certainly
 " The larynx which is composed of
 so ^{many} ~~many~~ cartilages & ligaments,
 all liable to ^{be} drawn into a state of
 exquisite and acute tension by the
 action of the numerous muscles
 which move them, must be essential

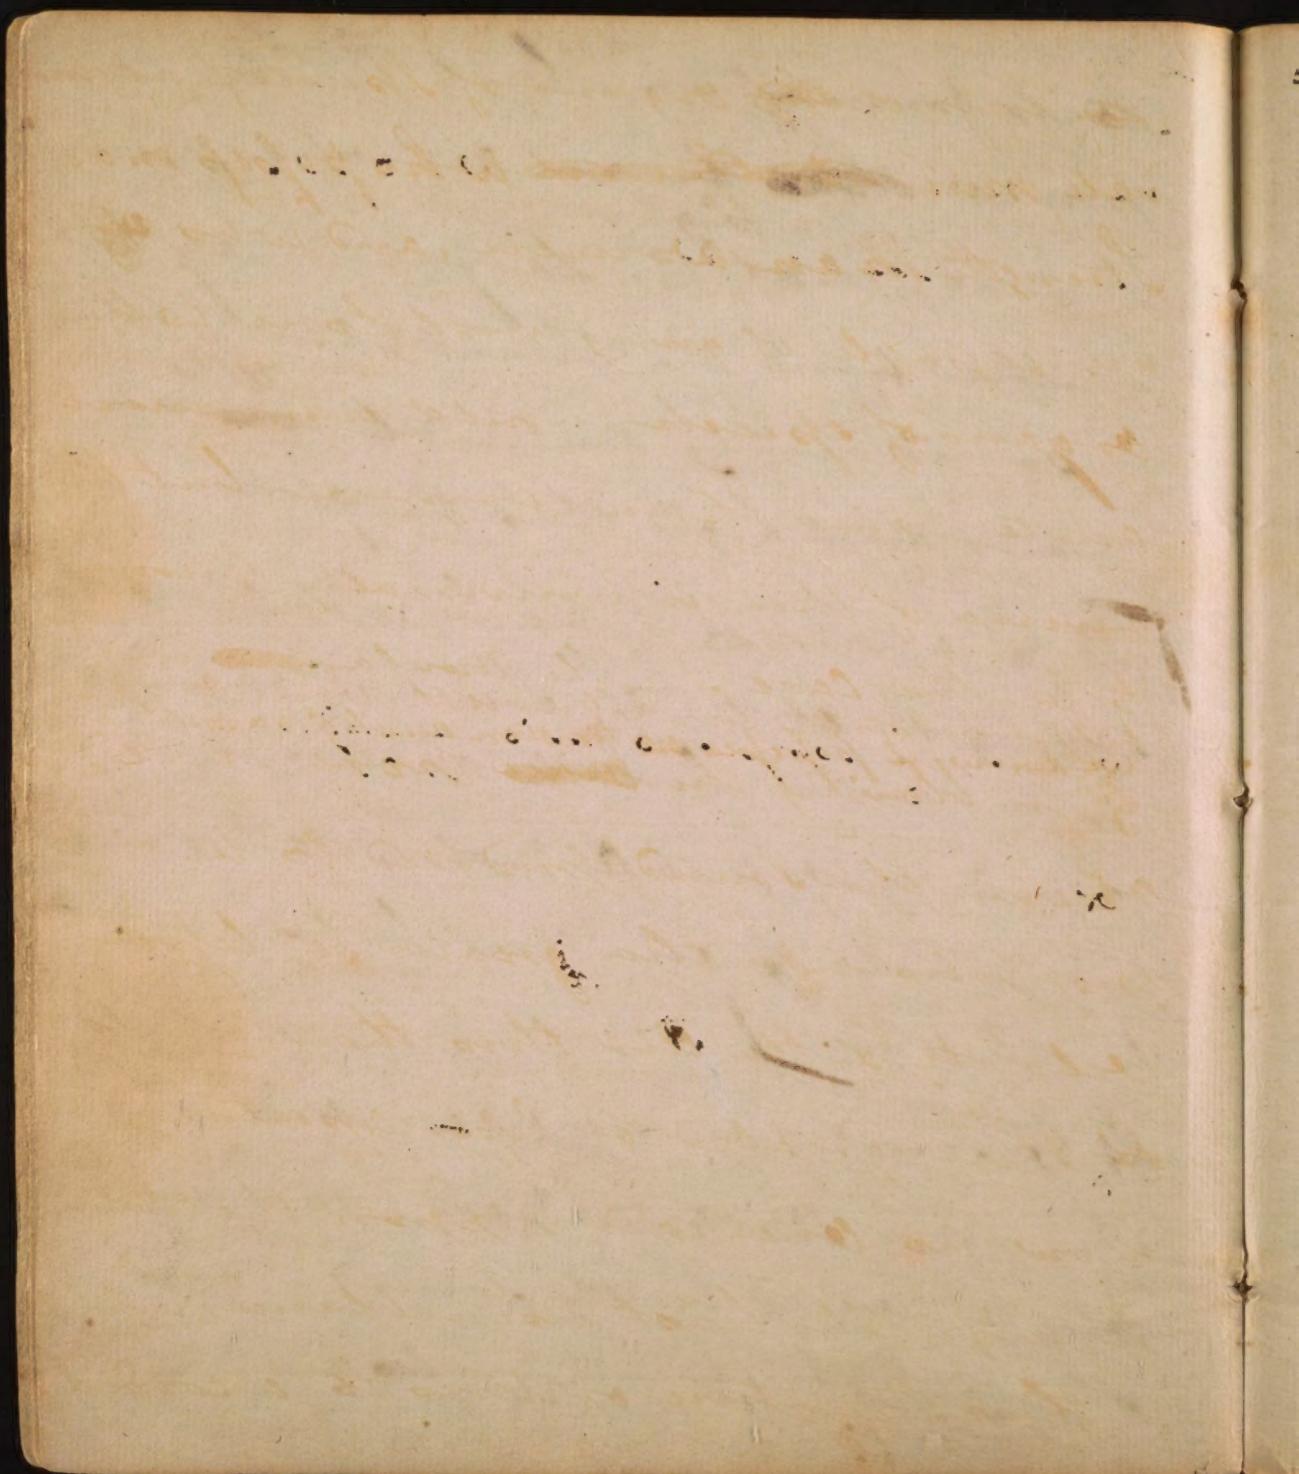

184 in his ^{long} Dissertation

to its formation, but Dr. Fox has proved ~~that~~ by an actual experiment, upon a pig, that the Larynx may be removed from the throat, and yet a sound nearly natural ~~be~~ ^{will be} afterwards discharged thro' the glottis. —

~~F 4 If a piece of wax be applied to the sides of the glottis, it does not change the voice - but the application of a piece of wax to a violin takes away its power of emitting but sound & vibration.~~

~~4 If sound depended upon cords, then the more tense the cord, - the more acute would be the sound, - and the stronger the person who emitted the sound, the more tense of course would~~

be the ^{his} 185
cords of ~~the~~ organs of Speech, - at this
rate, men ~~possess~~ who possess more
Strength than Women, and who ~~are~~
are capable of giving most tone to the
organs of Speech, would have more
acute voices than women - but the
reverse of this is universally known

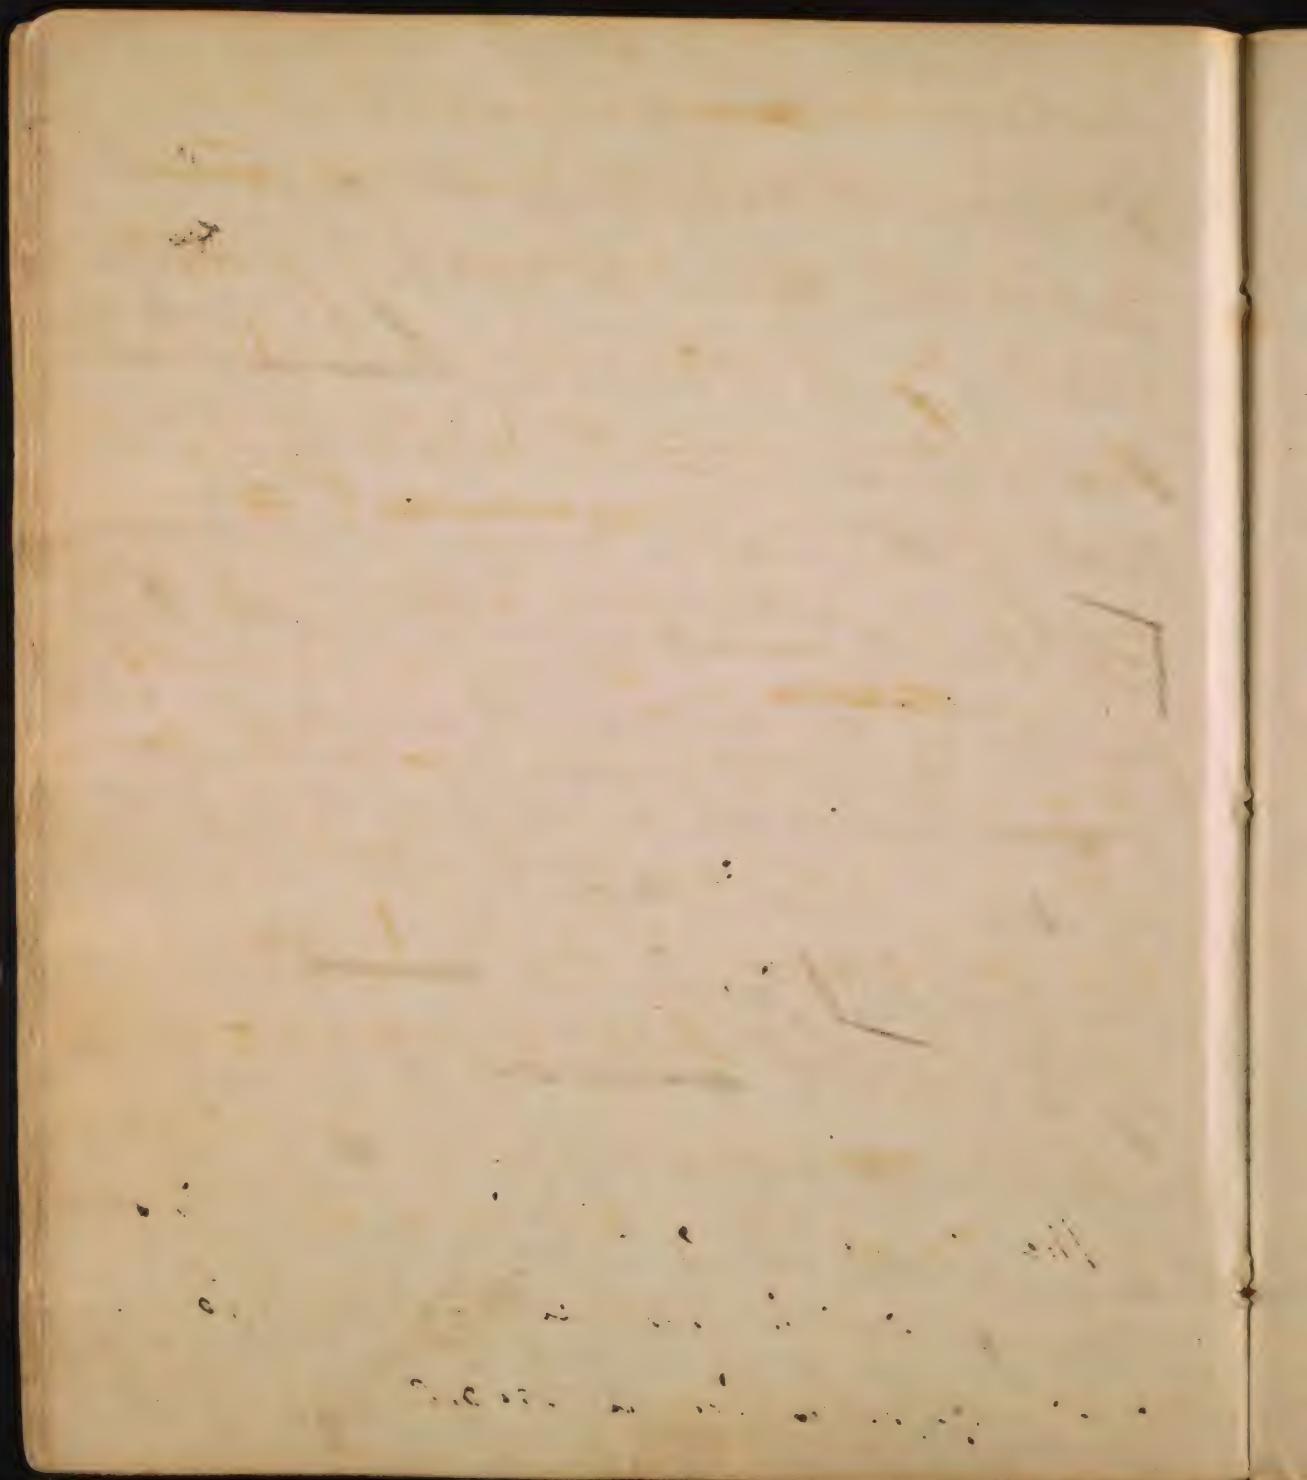

to be the case. - The Uvula ~~is~~ contri-
- butes much to the formation of the voice & yet
we know it possessing no muscle analogous to a vocal cord.
In blowing the ~~the~~ nose, we
observe the sound produced, to be in
proportion to the greater or less
velocity of the Air thro' the nostrils,
& to their greater or less aperture,
now no one can suppose the nostrils
to have the least resemblance in
their structure or uses to a corded

instrument. —

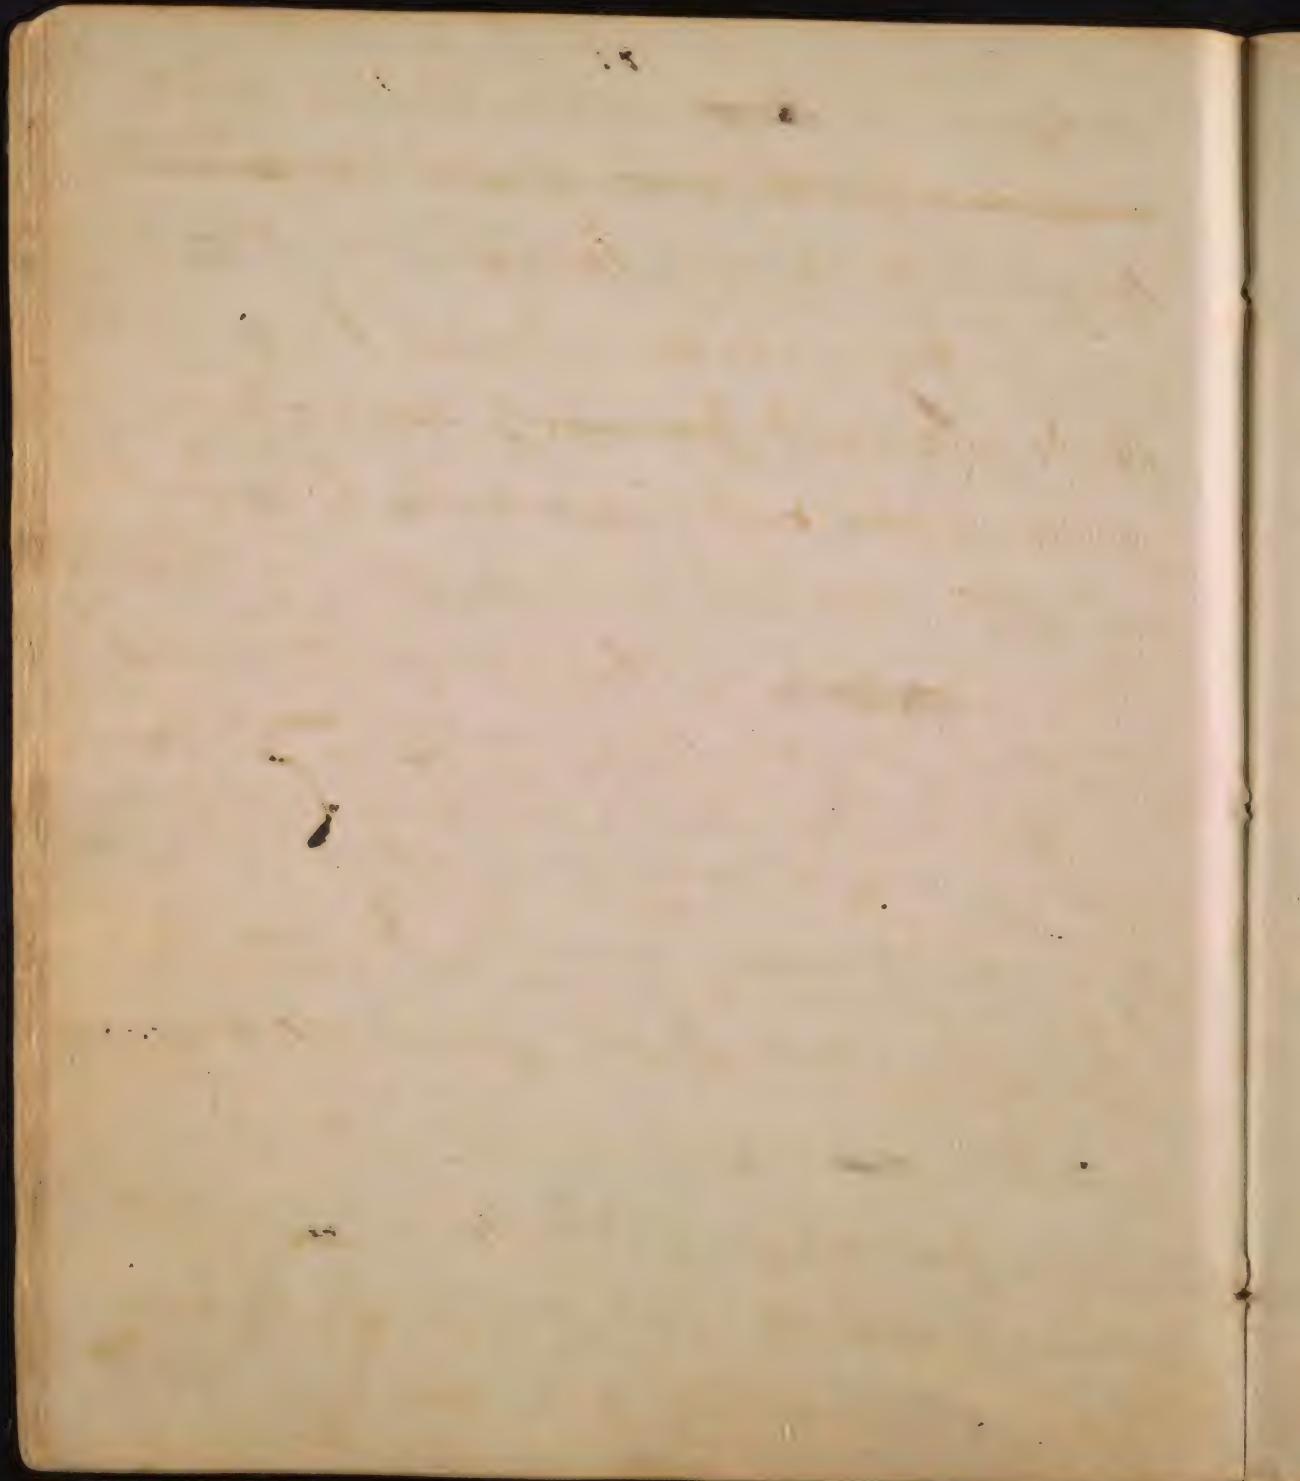

¶ The resemblance of the organs w.th
from the voice to sundry wind
instruments of music, ~~and~~ ^{affords a} ^{strong}
strong presumption that sound in
both of them depends upon the cause.

~~¶ Its sound ^{increased} in its strength by
the size of the passage thro' which air
passes ^{as} in a wind instrument.
So it is — in the organs which compose
the voice. ¶ Its sound ^{increased} increased
by the ^{or tension} solidity, ~~and~~ of bodies thro'
which it passes. So it is in the
organs which compose the voice.~~

— Is sound increased by reverberation
as in the conque Shell? So is the

Voice; - the ~~soft~~ Larynx - the Pharynx.
 - the mouth and the nose all ~~concur~~
 to answer this purpose. - Is ~~it~~ ^{found}
varied by certain uneven surfaces in
 the instruments thro' which it passes.
 So is the voice, - ~~varied~~ ^{found} by the
 by the number and difference of Apert-
 tures ~~thru~~ in the instruments
 thro' which it passes? So is the Voice.
 - It is most powerful, when it passes
 thro' the Glottis; mouth & nose in
 their greatest state of extension. -
 - Is the ~~one~~ degree of sound proportional
 to the quantity of air in a Wind instru-
 ment which produces it? So is found.
 This appears in a more especial

manner in Birds who tho' small,
~~are~~ emit
 sounds which are far greater than
 the sounds emitted by
 many animals of a larger size; now
 Birds we said formerly contain res-
 -ervoirs of air not only in their lungs, but
 in little cells which are connected with
 them, as also in their very bones and
 feathers, ^{all of} which they employ, ~~as~~ not only
 in Respiration, but in singing [There is
 another circumstance familiar to the
 organs which compose the voice of Birds
 which deserves to be noticed. This ~~is~~
 Wind pipe is divided by means of
 a double glottis - the one ~~is~~ is placed
 in the bottom of the trachea - the
 other ^{which is cartilaginous} in the upper part of the larynx.

✓ A th argument in favor of the
~~the~~ voice being formed upon the
principles of a wind instrument ^{is} that
not only the human voice but human
speech may be imitated by an echo;
note this we know is produced by the
resibration of sound only, & ~~is~~ is no
ways influenced by any thing analogous
to a chord.

an 8th arg² in favor of this opinion is
derived from the influence of certain
diseases upon the voice. an abscess in the
frontal sinus ^{as} Cline tells us
in particular has been
known to render the voice dull - nor
could it be cured till the matter of this
abscess was discharged. ~~it~~

This structure is ~~possibly~~ ^{possibly} calculated to 189.
~~which produces~~ ^{which} produces a reverberation in
sound, and to supply the absence ^{of} ~~to~~ ^{of}
those sounding bodies which are to be
met with in the heads of men, and
many other animals. } ^v

Having mentioned the arguments which render it probable that ~~the~~ the Voice is produced by the discharge of air thro' the glottis, I go on to ~~unite~~ ⁱⁿ the variety of tones which ~~are~~ are observable in the voice depends wholly upon the variety of motions in the glottis. — in Dodart in the memoirs of the Royal Academy of Sciences computes these motions to a ^{moment} to 9632. — This number would be incredible did we not know that the ear has in some cases been so far

1. *Leucanthemum vulgare*

2. *Leucanthemum vulgare*

refined by music so to be capable of distinguishing such an immense variety of sounds as may ~~serve~~ serve to illustrate Mr Dodart's calculation. Musicians divide time into what they call a Batuta quadrata or the largest touch which is the $\frac{1}{15}$ part of a minute. This portion of time, they again divide into four equal parts, each of which they subdivide into fifteen parts, so that at last four seconds of a minute are divided into sixty four parts, and the whole minute of time into 960 parts. Now Skilful musicians know how to run thro' the 64 parts of the $\frac{1}{15}$ portion of a minute so exactly, that they are able to distinguish each particle of the time that has been

Voicewords are acute & grave according
to the greater or less contraction, or
expansion, elongation or shortning of
the glottis. In uttering of acute and grave
sounds, the =.

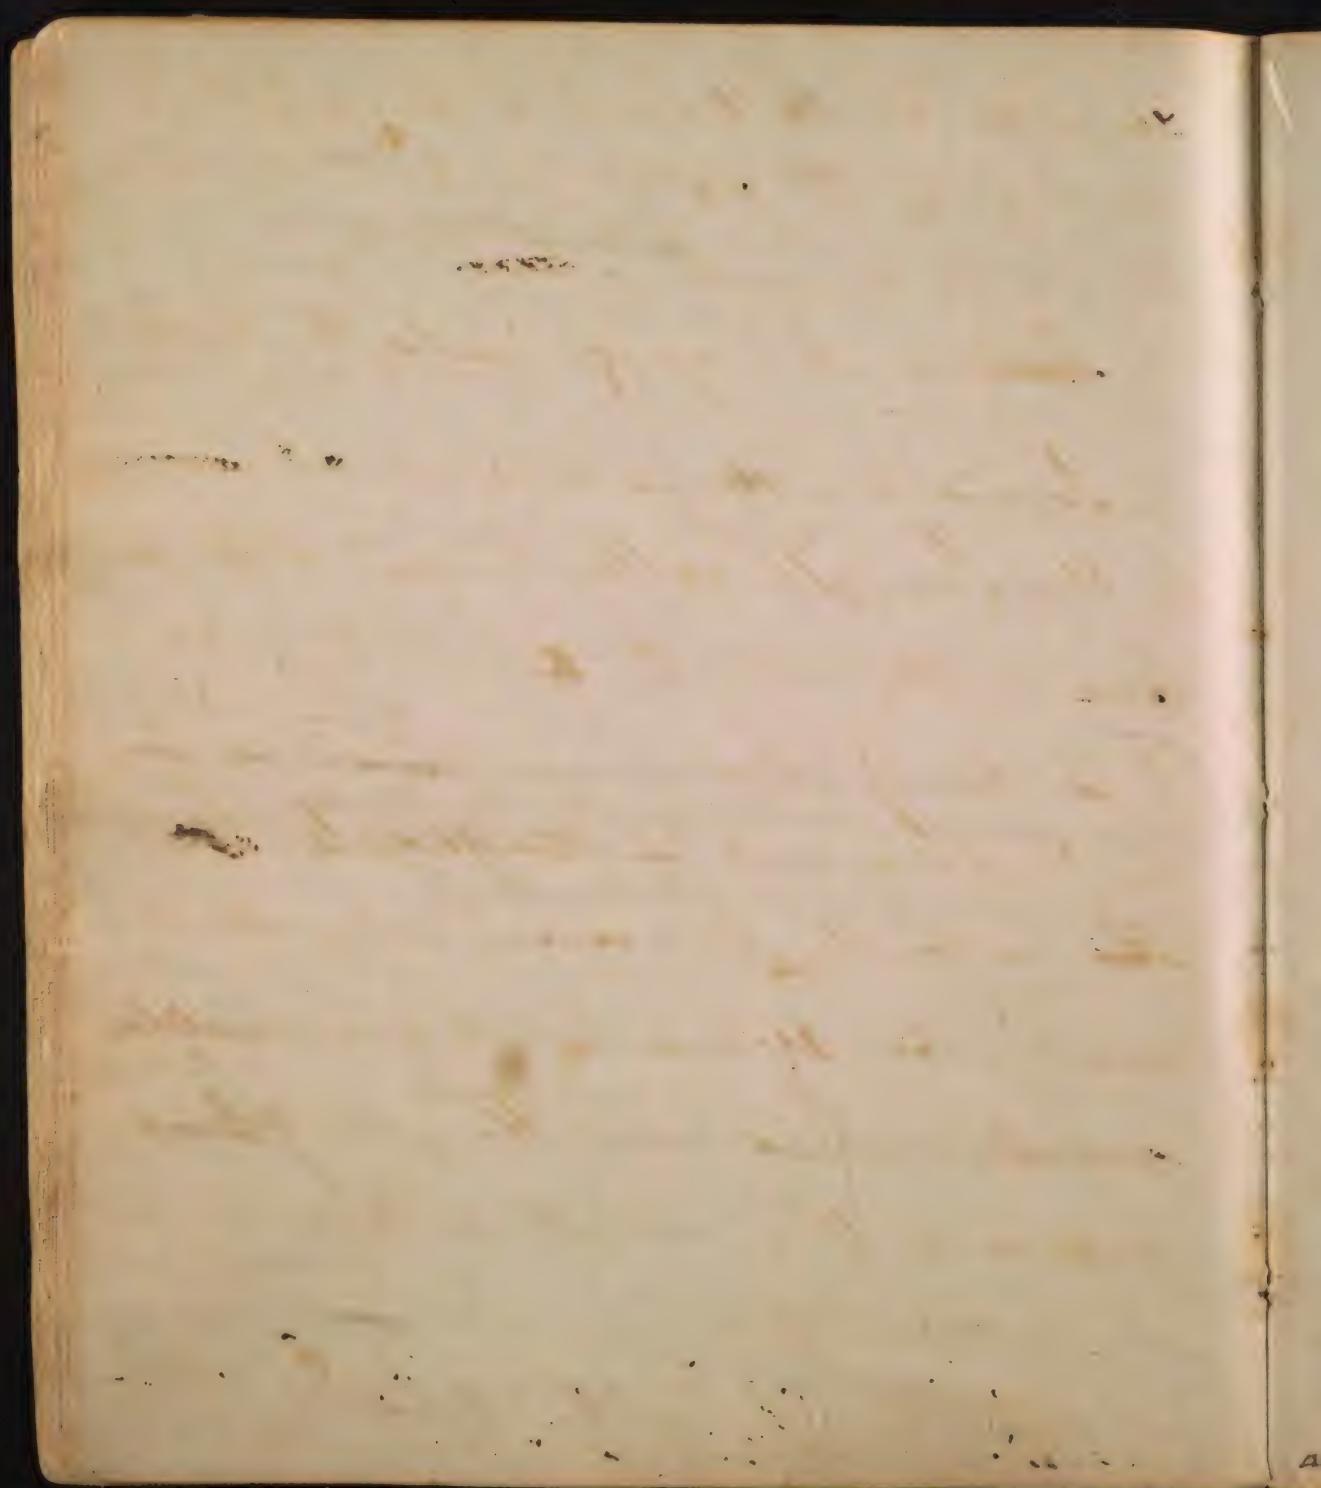

191

mentioned, of every one of which is produced by ~~the~~ a different action in the muscles which ^{more} ~~open~~ the glottis. But the number & variety of the emotions of emitting sound ^{instance of acute} the glottis ^{is} go far beyond this observation and perception. } —

Sounds are divided into acute and grave, and into strong and weak. ✓

The acute Sounds are produced by grave according to the greater ~~by~~ ^{acute} contraction of the glottis ~~or~~ ^{or} shortening of the glottis. For uttering acute and grave Sounds, the

= Voice is sometimes lost. — This depends in the ~~grave~~ case, upon the ^{of acute sounds} glottis contracting so closely as to confine the ^{case of grave sounds} sound altogether — In the ~~acute~~ it depends upon the glottis expanding

so wide, as to leave no rising between the tips of the glottis, and the Larynx - by which means no ~~expulsion~~ ^{collision} is given to the ~~air~~ ^{air} in its passage into the mouth.

Sounds are strong and weak ^{according} to the strength of the lungs, and the force with which Air is expelled thro' the glottis. — Hence it is weak in children and in old people. ~~hence~~ ^{men.} It is probably the reason why it is weaker in women than in old ~~people~~ — tho' some Physiologists suppose the glottis to be more contracted in women.

Whispering is produced by ^{so} weak an expulsion of the Air ^{from the trachea} as to produce none

The trachea is elongated & shortened
with the greater or less length of the
tones, &c. The exercise of the trachea, &
glottis in singing are more fatiguing than
in speech. In singing base, the peritoneum
is ~~so~~ very much protruded, & relaxed,
and whence the frequency of ruptures
of fat ^{bellies} among ^{who are great singers} the monks in Catholic
countries. —

193

of those tremors in the Larynx; - bones of
the mouth - nose - and head which produce
~~make~~ a distinct voice. ~~of the same~~
~~make~~ These tremors are perceptible by
~~making~~ the hand on the ~~same~~ head
of a person who is speaking ~~with~~ with
a distinct voice, but they are wholly
imperceptible if he speaks only in
a whisper. —

Singing is the protraction of the ~~same~~
~~protracted~~ ~~power~~ voice. The tremors
produced by singing are so great as to be
diffused thro' the whole body, - ^{so much} ~~so~~
that persons of nice perceptions have
declared that they have felt them in
the bones of the extremities. —

The voice changes in men at

8 It is likewise varied by the bresather. The
notes of the nightingale are always sweetest
in the month of may. The human voice feels
the influence of the Vernal Sun, tho' in a less
degree. It is varied by pain, & different pains
different times: - ~~as~~ ~~as~~ ^{proper} ~~as~~
2. * ~~the~~ ^{voice} is in part imitative - hence
we find men of the same country &
family have frequently the same
kind of voices. There is a case upon
record by a german author of the
name of Schillermauer ~~of~~ of a boy
who by being trot up among swine
contracted their voice so exactly in
speaking, that it could with difficulty
be distinguished from it. The citizens of the
different states of America bray all be dis-
tinguished by a sameness & peculiarity of
voice.

In order to the voice being clear
the passage of the ~~air~~ ^{air} thro' the nose
should be easy & perfect. when

at puberty

194

magnitude &c

~~comes~~ from an increase of strength in ~~size~~ at that period of life to the ~~accident~~ ^{larynx} ~~accident~~. The bones which assist in the formation of the voice likewise suddenly ^{increase} ~~increase~~ at the age of ~~puberty~~. The suddenness, and inequality of the growth of the body at this period, I shall say hereafter, is a source of many diseases. —

The voice is much varied by the passions. - It is quick and strong in anger - weak and plaintive in distress - soft in love & slow in supplication - all these changes are produced by a difference in the ^{or action} contraction of the glottis. \star^2

\star The eminent nerves is essential to the formation of the voice. By dividing it, the voice is destroyed. a weak

the nose is obstructed, we are said to speak thro' it. The reverse of this is true. we do not speak thro' the nose. ~~#~~ see below

~~But in explaining the feature & cause of voice I must not forget to mention that there ~~are~~ ^{is} to be men who speak from their stomachs instead of their lungs. This is a deception! The voice~~
~~They are called ventriloquists.~~

~~# The modifications of the voice depend on the size of the glottis ~~the~~ ~~size~~
~~of the larynx, & the length of the trachea &~~
~~the size of the larynx & the length of the trachea.~~
~~Size of the larynx & the length of the trachea.~~~~

~~— The voice is stronger in a standing than in a sitting posture. This is so much the case, that it may be perceived in a congregation when they rise to sing the Doxology. It is improved by certain ^{knowing} ^{delight} - from mind: excitement: & it is weakened by eating a full meal, from the stomach helping up the ~~thorax~~ & lessening their capacity for air out of which the voice is formed. ~~I~~ I cannot conclude this act.~~

or paralysis of this nerve is, ^{probably} the most frequent cause of Paraphonia - & Aphonia as we shall say hereafter. —

Thus far have I endeavoured to account for the voice. But in considering the ~~functions~~ of the human body our inquiries must not stop here. — A voice alone would give man no pre-eminence above many other animals. It is by the division of this voice by means of a ~~many~~ thousand partitions ~~that~~ into what is called Speech that man acquires a rank in the scale of being more singular and unequivocal than that which he derives from his Reason, ^{operations of} for in the exercise of this ~~faculty~~, ^{the mind} many animals have approached very

of the voice without taking notice of the provision
made to prevent its excess injuring the larynx or
brain, ~~and~~ that is the ~~thyroid gland~~. By opening
its arteries it prevents the escape of the ~~thyroid~~ ^{thyroid} ~~gland~~
& an undue quantity of blood being sent to the brain
where we hollow, or speak very loud or for a
great length of time. — That this is the case #

V 1: that ~~it is~~ ^{there is} ~~no~~ ^{there is no} ~~there can be no~~
Speech, where ^{when it is} Respiration is not voluntary.

2: Speech is formed principally as far as the
larynx ^{larynx} contributes to it, by the Glottis.

If the ~~larynx~~ ^{glottis} be cut be below
the glottis — there will be neither voice
nor speech — If above, — the glottis, there
will ~~no~~ voice, but no speech, which

is ~~more~~ rendered more certain by those
animals which have no voice having no
thyroid gland. This in ^{the} winter ~~days~~ is
the case in the whale — but ^{curious} it
says — is not so in the dolphin & seal.

~~I am sorry to say~~ ^{as far as} Blumenbach Comp.
Anat: p: 278. ^{two} vols

196

near him, but in the exercise of Speech
he stands alone. - I exclude here the
words which certain birds have been
taught to utter from my ideas of Speech.
- They are wholly unconnected with ideas,
and are as truly unanimal as any
of the antic emotions which have been
taught to dumb animals. ~~it~~

I begin my ^{account of} ~~of~~ ³ Speech
by remarking, that it is wholly imitative,
and that if Children were not taught
a language of some kind, they would
be forced to convey their ideas like
brutes ^{dumb}, animals, entirely by signs or
inarticulate Sounds! ~~it~~

However simple the ^{function} ~~life~~ of
Speech may appear, ^{it is} ~~it is~~ ^{the} ~~acquired~~

~~It was supposed the thyroid gland served
the further purpose of assisting the impetus
of the blood to the brain, and thereby of
upping the proverys of cephalic diseases,
but don't ~~start~~ ~~start~~ this opinion
was founded upon an experiments made
see below~~

These organs are the larynx - ^{glottis} throat -
palate - tongue - mouth - ^{upper} ~~lower~~ lips and -
nose. ^{Several} ~~one~~ of these parts are prepared
for their ^{respective} offices by being supplied by
certain previous exercises.

by Mr Cooper who found that dogs
lived ~~die~~ from the loss of this
gland. ~~He took the glands~~ There
must have been ^{suspect} some mistake in
this experiment, for in many persons
in whom this gland has been dissected
there has ~~not~~ been any diminution of
intellect, nor any other disease of the
brain. I believe its ~~use~~ is principally

immense difficulty¹⁹⁷ - seldom in less
than 15 or 18 months. I have known
three instances in this city of its
not having been acquired ~~in~~ before
the 8th year of life. -

~~Geopgraphy~~ In delivering the prop-
~~o~~ by which children learn to speak,
I shall confine myself to facts which
have been the result of ^{my own} observations, [made
chiefly in my own family] -

To render the organs of speech ^{sufficiently}
enable them to pronounce the ~~words~~ in:
- mense number of words which com-
- pose a language, it is necessary
they should be ^{properly} exercised for that purpose.
[This exercise begins in the Glottis
and extends to the larynx & wind in the

to prevent the impetuosity of the Lucyox
in loud singing & speaking. It probably
the further use of ^{emotion} ~~to~~ ~~excite~~ sensations in
serves to ~~arresting~~ ^{excite} sensations in
hypnotical women and others to protect
the brain. but ^{of} this more hereafter.
return to p 194 [✓]

List

1 The Larynx & Glottis are exercised 1 by crying. This is because the sight of pain seems to be unwelcome to parents, is wisely sent to set the muscles of the Larynx & glottis in motion. ~~as well as to procure~~
 relief from distress. - I think I have observed in one instance the effects of this ^{motion} upon speech, - for the crooked child I ever knew spoke distinctly before it was 18 months old.

2 The Larynx & glottis are exercised by Laughing - This begins early in life, and is attended according to its degrees, with very different dilatations, and contractions of the Glottis. ^{Another} Perhaps the principal reason why crying & laughing are peculiar to the human species is to form the requisites of speech.

3 Crowing - This exercise generally begins about the 5th month. It is

See here again - the uses of ~~the~~ ^{breath} crying -
laughing &c - Besides promoting Respiration
by its means Animal life, they are
necessary to the production of Speech!

expulsion 199
inspiration

a slow ~~expulsion~~ of the air this the
brings attended with the sound of bre-
ath - ~~breath~~ - ^{passing sound} It is to parents generally a very
pleasant sound of the ^{muscles}
The tongue ~~are~~ exercised about the
7th or ^{8th} month. Its first sounds are
generally dad, - dad, - dad; - hence
the origin of the epithet Daddy - It
is assumed ~~by~~ ^{of a child} ~~father~~ as the first
attractation to its father. Take notice here
the lips are not exercised in pronouncing this word.
The muscles of the lips begin to be
exercised about the 9th or 10th month by
uttering the sounds of pap - pap - pap
mam - mama - mam - ^{mam} - hence
the origin of the epithets - Papa &
mama. - It is remarkable that
in most of the languages we are
acquainted with, parents are called by

✓ Sometimes children exercise their lips by playing ~~on~~ ^{on} them, or blowing wind thro them in the following manner.

[Here show both]

+ This very name is derived from the latin word Vox, ~~and~~ voice - to denote their occurrence in language to be such as that they are a part of the voice, preparatory to speech. Consonants are the flesh & muscles of languages. They are all ^{the} ~~in~~ ^{below} ~~the~~ preparation of children to acquire

Speech is further assisted by the growth of the fore teeth, which are generally formed before they are 18 months old, & which in every period of life are useful in the formation of speech.

soft & agreeable in proportion as they abound in vowels. ~~the sound of vowels is the most agreeable~~

The Greek & Italian are the most agreeable languages ^{in the world} to the ear upon this account. The German - Swedish, Danish & English are the last ^{from me}, from their abounding with consonants. ~~the last~~

Names which have some labial letters in English. Dadda - Papa - mama in French - in German - no ~~father~~ - father ^{mother} - Pere - Mere - Pater in Latin - Fader & mader in German - madre - padre in Spanish - ~~father~~ ^{Chinese} - Foochin - father & moochin mother in the language! By the constant exercise of the muscles ~~of~~ which move ^{the} glottis - tongue - tongue & lips - in this way, for 18 months or two ~~years~~ years, children are prepared to acquire the knowledge of a language ~~or~~ ^{of} articulate sounds. - It is remarkable that in all the sounds which I have mentioned, we find some of the vowels - for these are the skeleton of all languages.

Language or words are acquired by children ^{like} ~~like~~ speech only by imitation. The ear and the eye are the avenues through which the use of speech is conveyed

There is one of the consonants ~~so~~
which has been distinguished above all others,
not only upon the ear, but
by its ungrateful effects upon the ^{whole} body &
that is the letter R. —
Salomon relates a story of a German
of the name of Kesteng who was taught
the letters of the alphabet by placing his
hand upon his wife's mouth & discovering
the exact motions of which accompanied
her pronouncing every letter. Upon her
pronouncing the letter R — a sense of horror
~~was~~ attended with shuddering, pervaded
his whole frame. ~~It~~ would ^{aristhere} ~~seem~~ exist
a natural Antipathy to this letter in the
human ear & hence it seldom occurs in
the languages of the Indians ^{nor} of the
Africans. From the latter, the inhabitants
of countries in which negro slavery exists
have learned to leave out the letter R

to them. -

~~the~~

After children have ^{been} brought forward as it were their little organs of speech to their parents' ^{completely} supplied by the exercises ^{the} I have mentioned, ~~to their parents~~, they endeavour to imitate them in the pronunciation of single words. These words are ^{always at first} ~~qualitatively~~ substantive nouns. - In their first attempts they make many mistakes - the sounds they utter are often as widely different as they can be from the words they are desired to utter, & But their little ears inform them of ^{their} mistakes and they attempt ~~to~~ to correct them. - This I suppose affords them exquisite delight, and if they repeat the word

in most of the English words in which
it occurs - ~~the words~~ hence we hear
summa - winter - ~~supper~~ - ~~fire~~ - ~~feast~~
winter - paper - dinner - supper - feast
& fire ^{nowise} ~~nowise~~ ~~of the last~~ ~~day~~
summa - winter - papa - dinner -
supper - feast and fire - by persons of
the first rank in these countries.

~~It is~~ ^{A kind of} ~~it is~~ Rphobia seems to
have crept into their language. ~~It~~
go back to Op 200
opposite side.

they hit upon, half a dozen times, they
seldom forget it - but if they do not,
they often lose it - and sometimes
do not recover it for two or three months.

- If children can make you understand
what they mean, when they call any
thing by a false name, they will
seldom take much pains to correct it.

- I have known a child call a chariot
a tar - & sugar, Billy - long after he could
pronounce half the words in our language
merely because his parents consented
to know what he meant by them.

In acquiring a language, chil-
-dren are much assisted by looking the
persons in the face who speak to them.

- They acquire in this way ~~a~~ much
easier ~~and~~ ~~and~~ the pronunciation

They likewise acquire words much sooner, when they are sung to them than when they are only spoken ^{and for this reason, as you said,} words thus, dwell longer ^{upon} the ear, and ^{being} associated with pleasure, as more pains are taken to retain them. It has been said that ~~ideas were originally conveyed~~ in musical tones, and that ^{language} has lost its tones by the habits & pleasures of civilized life. It is certain all savages are fond of music, that they express their passions in musical tones, & that even their ~~unintelligible~~ voices are tinged with them. ~~incomprehensible~~ Their tones ^{moreover} are not only simple, but extremely plaintive, & melancholy - a proof among a hundred others that might be mentioned, that they are ^{every where &} uniformly ~~bad~~ miserable. To return -

203

of all those words which are spoken
by the motion of the lips. ^{of this} ~~more presently~~
The pronunciation of a child is
seldom correct at first, — everywhere
the uttermost pains have been taken
by parents to prevent their being spoken
to in a childish manner. — Those words
in our language which have ~~the~~ the letters
th — connected in them as this — that
the &c are always learned with a
great deal of difficulty. Foreigners seldom
pronounce them perfectly.

Speech ^{is not only acquired by} ~~is not only~~
^{many of} imitation, but its peculiarities are
influenced by it — hence whole com-
-munities — towns — families — & schools have been
remarked to speak alike. These peculiarities
are acquired chiefly under 12 years of

V will illustrate what is meant by each
of those distinctions of sounds in different
languages. A. and O. ~~produce~~ glottal ~~the~~
B and P ~~produce~~ labial ~~the~~. C and S. ~~the~~
dental ~~the~~ L and R ~~are~~ lingual ~~the~~
and M & N ~~are~~ nasal ~~the~~ sounds.

204

Age. After that period the muscles ^{dr.} w.
move the organs of speech are less easily
affected by irritation. I exclude here
those peculiarities of speech which are
acquired by affection. These are
picked ~~up~~ at every period of life.

Languages ~~are~~ differ from each other in
the different proportions of words which
are uttered by the ^{tongue teeth lips} throat - ~~are~~ exclusive
of each other. Hence ~~the~~ languages
are called guttural - ~~the~~ lingual -
Dental ~~the~~ tactual ^{and nasal the motions of} the throat
tongue or lips predominate in each of
them. The following letters of the alphabet

Indolence has a great influence
upon speech. Hence we find the fewest
muscles employed in the languages of
savages who are all indolent. The

& for the pronunciation of consonants
the ^{cavity of the} ~~uvula~~ - palate - nose - tongue - ~~teeth~~
~~lips~~ - ^{teeth} are all employed. - The Hebrews
early observed this, and have divided
their consonants according as they employ
these different parts into guttural -
palatine - Dental - labial & nasal.

Indians in this country use their tongues and lips as little as possible in conversation. Even ~~except~~ at public treatises, they grunt their assent to what is proposed to them this being their ~~method~~ ~~language~~ of ^{partake largely of} ~~language~~ ^{language} gathering sounds.

~~Indolence~~ Indolence has the same effect upon the languages of civilised nations. The plethora of Vowels, ^(If I may be allowed the expression) which composes the Italian language seems to have arisen from that cause - for ~~but~~ ~~but~~ ~~but~~ fewer muscles are employed in pronouncing words that ~~are composed~~ ^{are} abound with Vowels than Consonants.

The ~~Arabs~~ ^{Arabians} who are indolent from climate & government, use ~~but~~ ~~but~~ ~~but~~ their tongues only,

+ the same as in expressing the emotion of pity.

The Rapidity of Speech is much influenced by facility in hearing, & quickness of perception. - Old men speak slow - because they hear imperfectly. - It is likewise influenced by the greater or less velocity ~~of the~~ ^{of the} circulation of the blood. It is rapid in a fever ~~and~~ ^{of great morbid} action, also in anger, and it is slow in a fever in which the circulation is feeble as in the typhus, ~~also~~ ^{& also} in a depressed state of the mind. By attending to this remark we may know the state of a patient's circulation only by hearing him speak, before we feel his pulse.

206
in an affirmative] in a peculiar species

this the ~~way~~ the ^{way} - [Describe it.] +

* Thus - how I described the
origin - formation - variety of speech
among men. That the Am^r. I have
given you is a just one, I infer
from the speech which attended the
attempts that have been made to
teach the dumb to speak. It was
first a Spanish word of the name of Portius
and after ~~words~~ ^{words} being improved by

Persons dumb, but Mr. Dicard remarks, it
would be more proper to call them silent.

~~Watch them to understand what is said
to them. This has been so done, by watching
persons who are silent, ^{the dumb or} ~~so~~ to observe the
exact motions of the ~~so~~ tongue and lips in
the persons who speak to them, each of
which have ~~precise~~ motions for every
word they ~~say~~ utter. In this way can-~~

To understand the nature of this
useful ~~dearly~~ art, it will be necessary to
observe that in most of dumb persons
who are ^{originally} deaf, there is no defect in the organs
of speech. They do not speak ^{only} because
they cannot hear, and hearing is
the sense thro' which speech is
chiefly ^{only} acquired. — It is common to call such

The first thing done in teaching
the dumb to speak, ~~is to teach them~~

of which
✓ After they have been taught to understand
- stand what is said to them ^{by signs} is to suppose

The Scholar ~~is~~ then

to expel the air from his lungs, & to teach them to expel ~~the~~ air
thusly, & to teach them to expel ~~the~~
thus it is as to exite an inarticulate
sound. The larynx is supplied by frequent
- by pressing it. ~~the~~ ^{the} ~~sound~~ of the larynx
~~is~~ ^{is} ~~confined~~ to ~~the~~ ^{the} ~~sound~~ motions w.
it is ~~so~~ necessary to give the tongue
& lips in every word in a language,
^{so} ~~the~~ ^{the master would} direct the
~~and~~ ^{and} ~~the~~ ^{the} ~~sound~~ of writing ~~the~~
his teacher ^{letter} to make those motions in the instant
of their expulsion of the air from the
lungs. — E.g.: Suppose ~~he~~ ^{he} wished
~~he~~ ^{him} to pronounce the ~~word~~
"he" ^{letter} ~~word~~ would order him ^{to}
expel the air from his lungs two
different times in a quick succession.
During the first time — ~~he~~ ^{he} would tell
him to thrust his tongue against
the back of his lower jaw, & to ~~the~~

✓ In this way Dr Haller tells us
Ammermann taught a boy to speak
and - and wrote in one month. and a
girl in two months, but in general,
it required a whole year to complete
the education of a dumb or silent
person in the manner I have mentioned.

But Ammermann not only taught the
dumb to speak, but from his knowledge
of all the motions in the organs of
speech which take place in the pronun-
ciation ~~of~~^{of the} words, he corrected false
or bad pronunciation. For example -
directed a boy who used the letters (t) and (d)
~~to~~ instead of (k) ~~to~~ to depress the
tongue with his fingers ~~in~~ in order
to prevent ~~it~~ ~~its~~ striking the
upper teeth. - After a while he was able
to depress his tongue ~~from~~ the ~~in~~ power
his will acquired over it. ~~so~~

close his lips together²⁰⁹ at the same instant - this would produce the syllable pa - ~~During~~ the 2nd time he expelled the air from his lungs, ^{sup-} ~~the muscles~~ ^{tip of} ~~mouth~~ should tell him to raise ^{the} tip of his tongue towards the roof of his mouth and at the same instant to close his lips - the syllable uttered would be - pa - which ~~is~~ connected ^{the} ~~with~~ pa - would be ~~the~~ paper. ✓

Some words
are imperfectly pronounced from the ligament
of the tongue ~~being~~ ^{on the bottom} not being
cut in early life. I have in several in-
stances ~~seen~~ cured these imperfections of speech
by cutting this ligament where it has
been of a preternatural length.

Speech is impeded not only by the loss of
the foreteeth, but by their supernumerary size,
and ~~projecting~~ ^{growing in} clusters instead of rows from
the the upper & lower jaws. This defect in
speech has been corrected by removing some of
the teeth, or opening moderate apertures
between them, or reducing their length by
means of a file.

his lower lips every time he attempted to pronounce those words.

- They came ~~for the~~ ^{as soon as he did this,} ~~stranger & friend~~ with these proper ~~salute~~ to his great astonishment & delight.

V ^{been} ~~Dumb or silent~~ ^{lessons who have taught} to speak in the manner I have described, ~~are not able to speak~~ ~~are afterwards good imitators~~ are frequently able to hold a conversation ~~especially for~~ ^{Observing the motions} only by ^{repeat what he said,} of the lips of the persons with whom they conversed. - A man named taught a man to ~~speak~~ only by directing him to move his lips as he moved his, and at the same time to expel air from his lungs & to hear with his eyes, taught a boy so perfectly in this (if I may be allowed the expression) ^{take down} way, that he could ~~afterwards~~

It is recorded
✓ ~~privately~~ mentioned the ~~name~~ of
Karl Boerhaave, the nephew of the
celebrated Dr Boerhaave ^{that he} received
~~other~~ impressions upon his ^{ear} ears this
the medium of his hands & feet.
This was a translation of a ^{poem} since,
of which I shall speak more
fully here after. —

in writing a sermon, and afterwards
~~read~~ it word for word to his friends
when he went home. The Acuteness
of perception in the eyes in these
cases goes almost beyond conception.
It is possible they may perceive some
of those tremors ~~and~~ before ~~they~~ speak

of which are communicated to
the ~~head~~ in speaking, ^{for each word} ~~communicated~~
I have no doubt ~~itself~~ has its peculiar and
specific tremor or vibration. Should
this be the case, it would not ac-
-give more acute sight; that ~~it~~ ^{was} dis-
-covered hearing in the two Duttons
whose ~~history~~ you will find in the
~~beginning of the book~~ ^{in the fore part of} ~~the book~~
future of your animal life. V

~~descriptions~~

I shall have occasion to

✓ In explaining the nature of Speech, I
must not omit to mention that are men
called ventriloqui who are said to speak
from their stomachs. This is altogether
a deception. The Speech is formed by the
inspiration instead of the respiration of
air, and the Voice & Speech are in the lungs
& not in the stomach. I shall resume this
subject when I come to treat of sound.

In reviewing the wonderful ~~operations~~^{Gift & exercise}
of Speech, ~~it is~~ it is impossible not
to be ~~struck~~ struck with the number &
variety of those motions in the larynx
glottis - tongue - & lips ~~by~~ by which
it is performed. ~~The~~ The English
language consists of ^{more than} 40,000 words, nearly
every one of which is uttered by ~~the~~
motions in the above organs different

resume this subject when we come to ~~do~~ mention the ~~do~~ cases of morbid voice and speech in our pathology - when I shall explain some matters which ~~do~~ would be foreign to a lecture on Physiology.

~~It remains only that I mention the use of speech. But here Gent. I am up at a loss what to say than what to leave unsaid. I shall however only observe that by speech man is enabled to be stationary in his knowledge in sad because among all the creatures in the world. It is by means of speech that the venerable sage instructed his children before the invention of writing & printing - By the use of this function we carry on the business of the world - It is the instrument by which knowledge is~~

from each ~~the~~ other. This will not be incredible to you when you recollect the number & variety of sounds which I mentioned at our last lecture, and which are distinctly perceived by a good musical ear. — But our wonder should not cease here. we meet with persons who speak, with the Latin & Greek ~~but~~ most of the modern languages of Europe. The distinct ^{distinction} in the organs of speech of those persons probably amount to many hundred thousand, & are all at the same time so perfectly concert as to convey ~~the~~ in an instant, ^{apply} ideas to the persons who understand them.

I beg you would remember those facts.

I shall have occasion to ~~mention~~ ^{apply} them, ~~when~~ when I come to treat of the ^{operations} of the human mind.

243.

chiefly conveyed from man to man - It
is the visible vehicle of eloquence - of
friendship - and love. - ~~and~~ But above
all - it is the ^{one of} means by which we
are permitted ^{may & more - command} to address the great
father of the Universe, and to celebrate
his works among the children of men.

¶ ~~Mr~~ Boyle ~~and~~ we are told made
it a practice always to make a short
pause in conversation when he
mentioned the name of the Supreme
Being - Did we ~~not~~ contemplate fully all
that is known of the wonderful manner
in which the voice and speech are formed,
we should go beyond Mr Boyle in our
knowledge of the Deity. - ~~and~~ Every time
we uttered a word, that conveyed an idea
to a friend, or to the public, we should

remains now that I mention the
uses of Speech. By it, man is exalted
above all the creatures in the world.
Brutes are stationary in their knowledge
chiefly because they are ~~so~~ destitute
of this precious gift of heaven. ^{where} There
is no such ^{those} can be but few
ideas, for words are ^{said to be} the signs
of ideas. ~~those~~ They are the clothing
of ideas, and without them, ideas soon
perish in the mind. ~~those~~
~~of speech to the same stage~~
~~as~~ I shall only add that this precious
discriminating character of man, has been supposed
to be the result of the gradual & successive
operations of human reason. I cannot
aspire to this opinion. That Speech ^{has} exalted
man above the brutes, I believe at this day we

264

From

pause to admire the infinite wisdom
which is displayed by the divine
arbiter in the structure of ~~the~~ ^{those} organs
by which that word was pronounced.

Let 9th go on to p 216

[I have not yet lost sight of the human
figure whom I fancied I first met with
on a visit to our globe. After surveying
the manners in which the motions of
his breast were performed in Respir^{ation}
into a short digression by
I was led to enquire into the more
variously into the manners by which
in birds be uttered voice & speech. It
was then observed - Having
satisfied myself of the several manners
of each of them, I was next
led to inquire into the nature of
those involuntary motions which

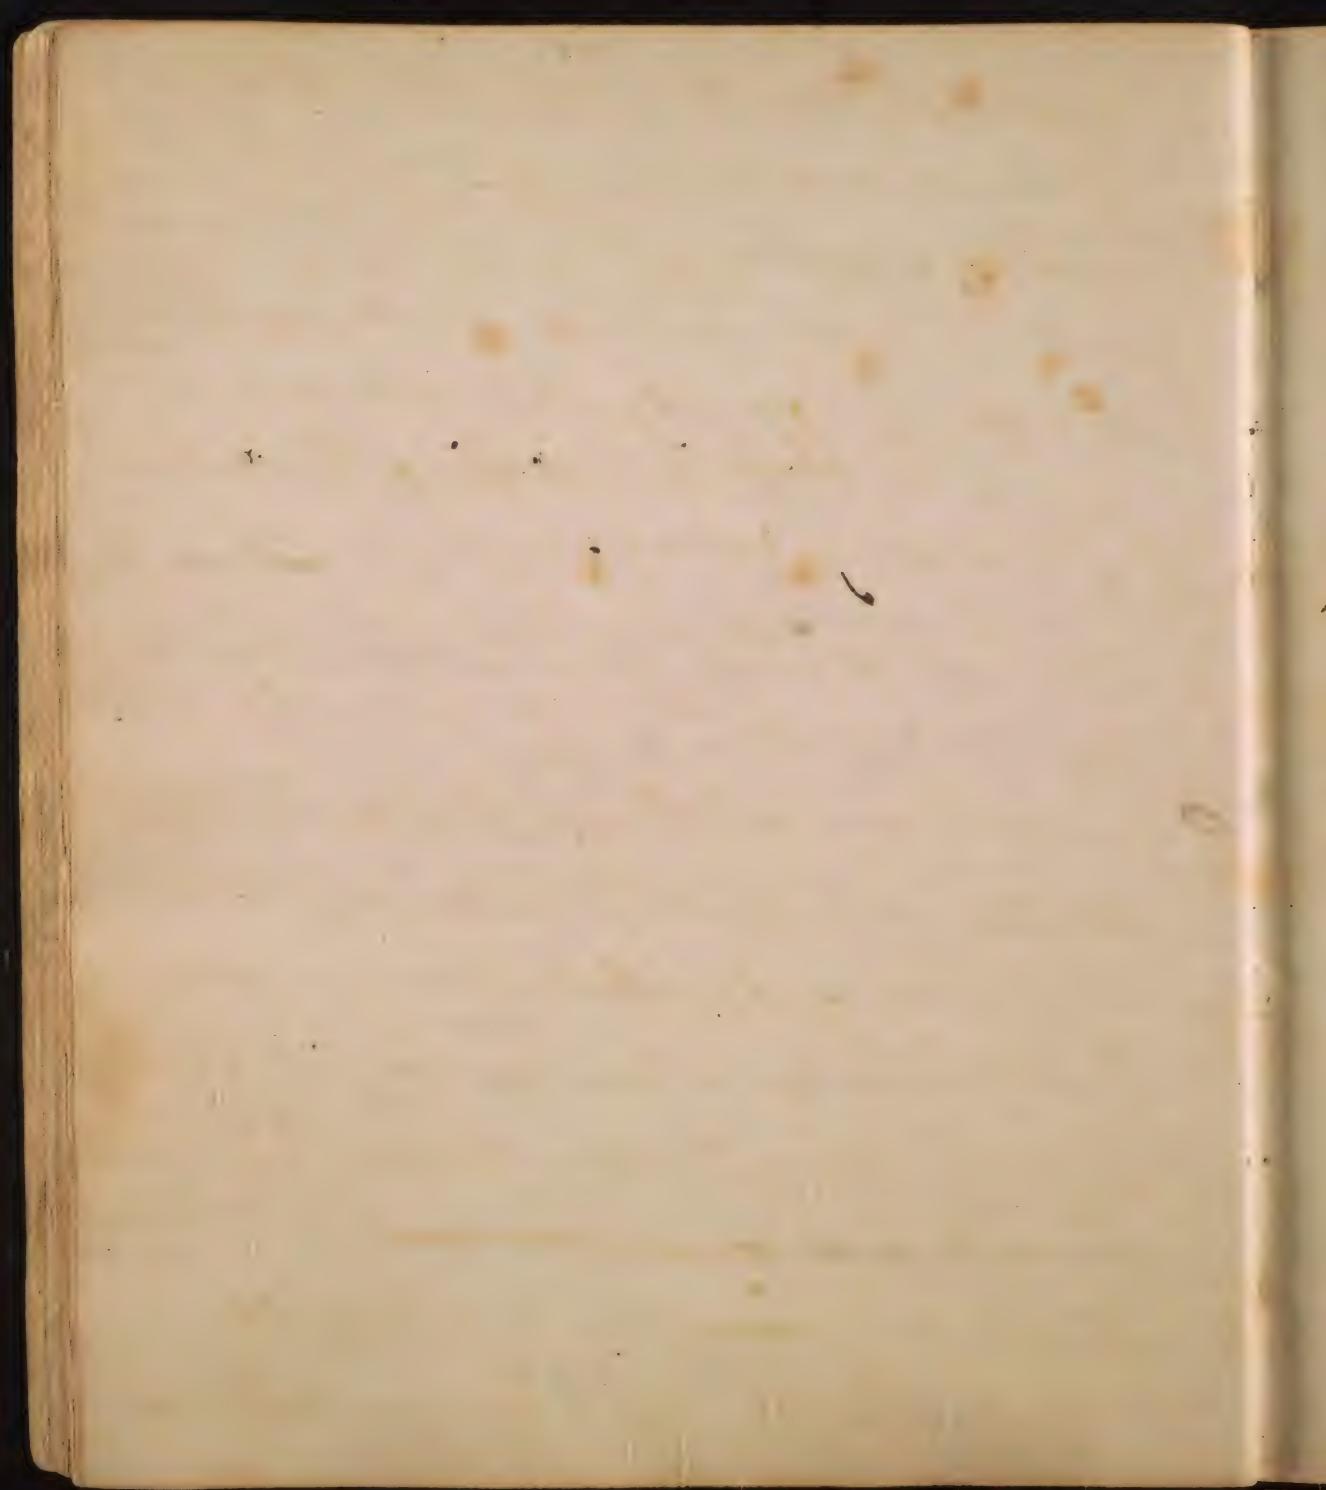

Should have been but little above our
Domestic animals in our attainments
knowledge of it. (There can be no doubt but
such was originally given by the same
~~same~~ divine power which multiplied languages
at Babel, and which ~~is~~ in after ages im-
-parted to the twelve apostles the gift of
languages, and that our great progenitor
spoke one of them as certainly as that he
breathed or walked; for the historian that
relates the one, relates the others. The posterity
of Adam acquired speech and language only
by instruction & imitation, as they have
done the knowledge of a thousand other things.
Our fathers have been to us what the cates
was to Adam. The only difference in the
manner of our learning to speak is, we
require 18 months, or two years to learn

lay beyond the reach of the eye sight,
 particularly into the motion of the
 heart — ~~— feel here — it passes thy~~
 in describing respiration. — Father
 said he — upon this, I imagined
 he placed my hand on his breast. —
 Beneath it, I felt a strong pulsation.
 — This said he is the heart. ~~It beats~~
~~beat on this stone~~ It has beaten in this
 manner for ³⁰ years without one
 moment's repose, — It is ^{in one respect} the fountain
 of life — a source ~~life~~ of mysteries — all
 the functions of the body depend more
 or less upon it. — It moves the brain,
 and is again moved by it — It furnishes
 the fluid from which all the secretions

to speak perfectly, whereas Adam was
divinely taught to speak perfectly in a few hours,
or perhaps in an instant. ~~so as to~~

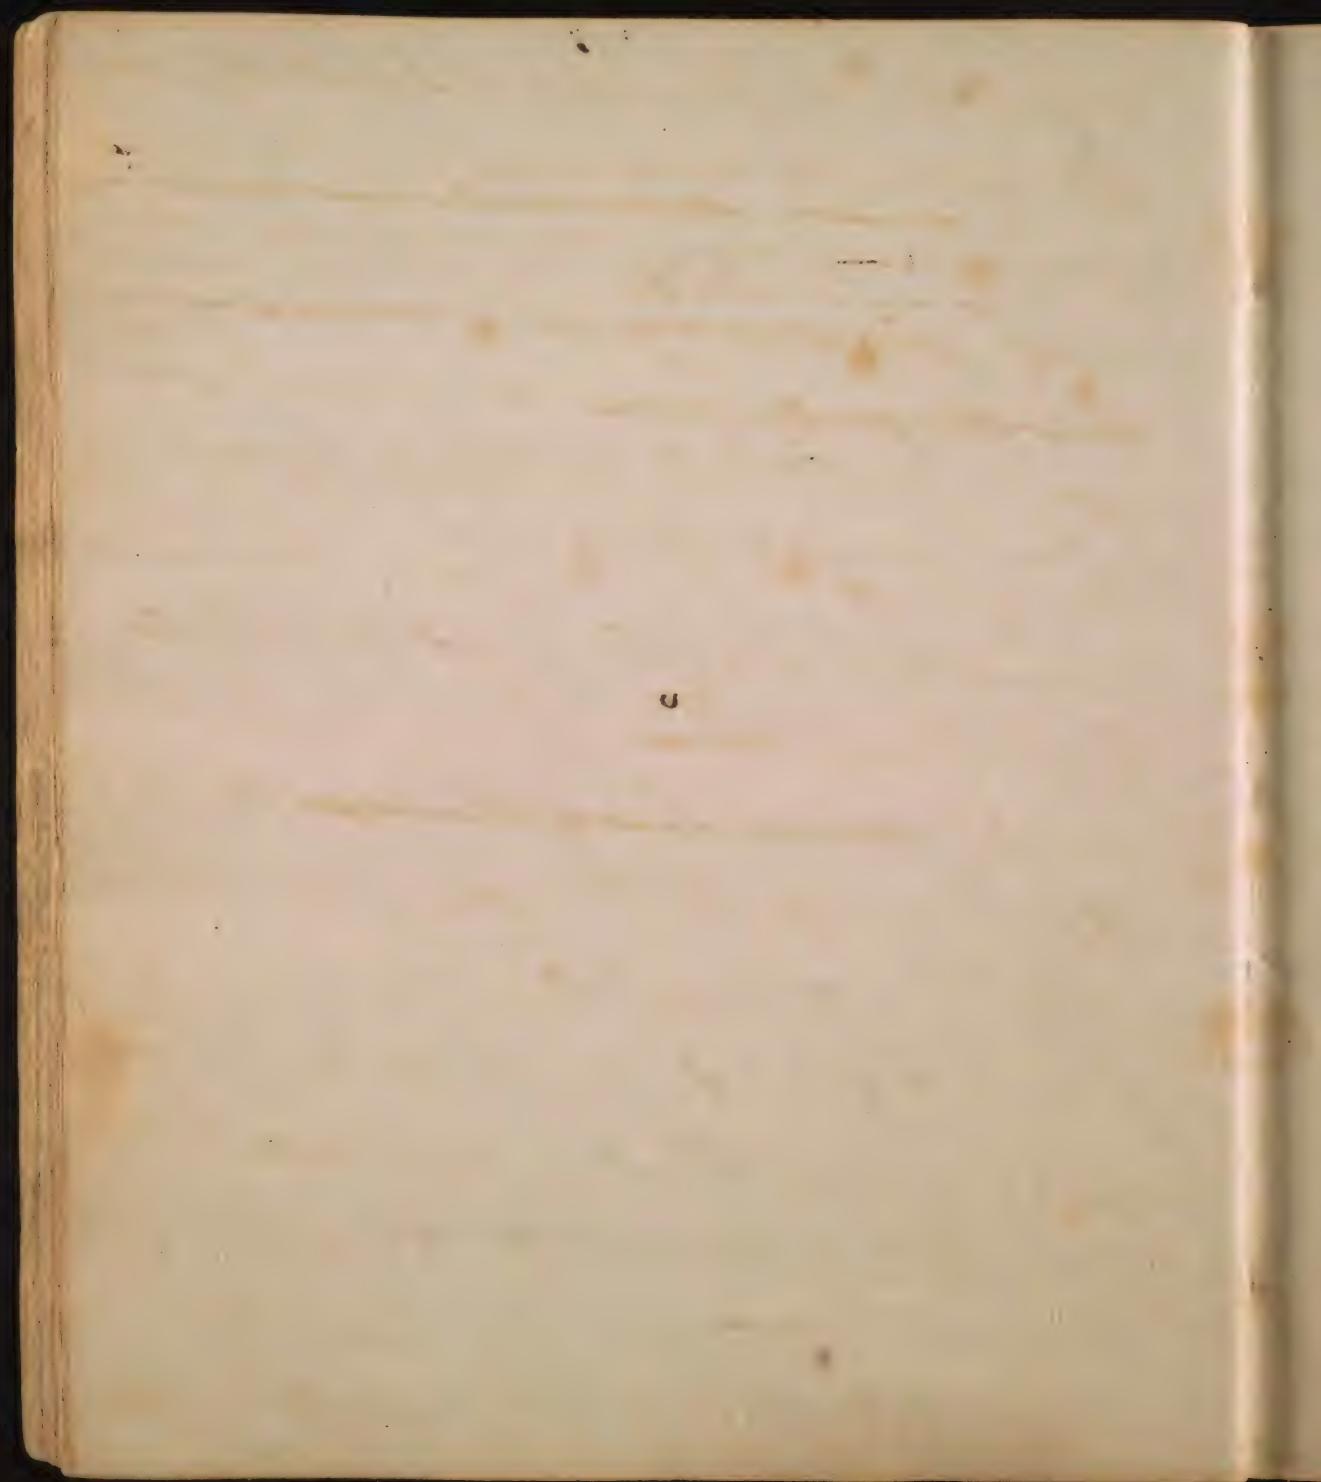

Having ~~taught~~ described the function
& uses of Respiration, more especially
its application to ~~Regulate~~ Voice
& Speech, we proceed next to treat of
the next effect of the inflation of the lungs ~~which~~
is the circulation of the blood. ~~and~~
here I shall first enquire into = p. 215

of the body are obtained, - in short its presence, and action are essential to ^{conserve} ~~conserv~~ life, in the most only in the human but in most of the animals in the world. The spicly Hydra & one or two animals are the only exceptions to this Observation. — But what is the Structure of this heart? In delivering the rest of the information derived in ^{way} ~~information~~ in this ^{first in} I shall, consider the ~~so~~ action of the heart ~~regarding into~~ = the course of the blood after it passes ^{the} ~~the~~ lungs when ~~it~~ ^{we} left it in treating upon Respiration. 2^o I shall ~~describ~~ ^{describ} some peculiarities in the Structure of the heart & blood vessels. 3^o I shall inquire into

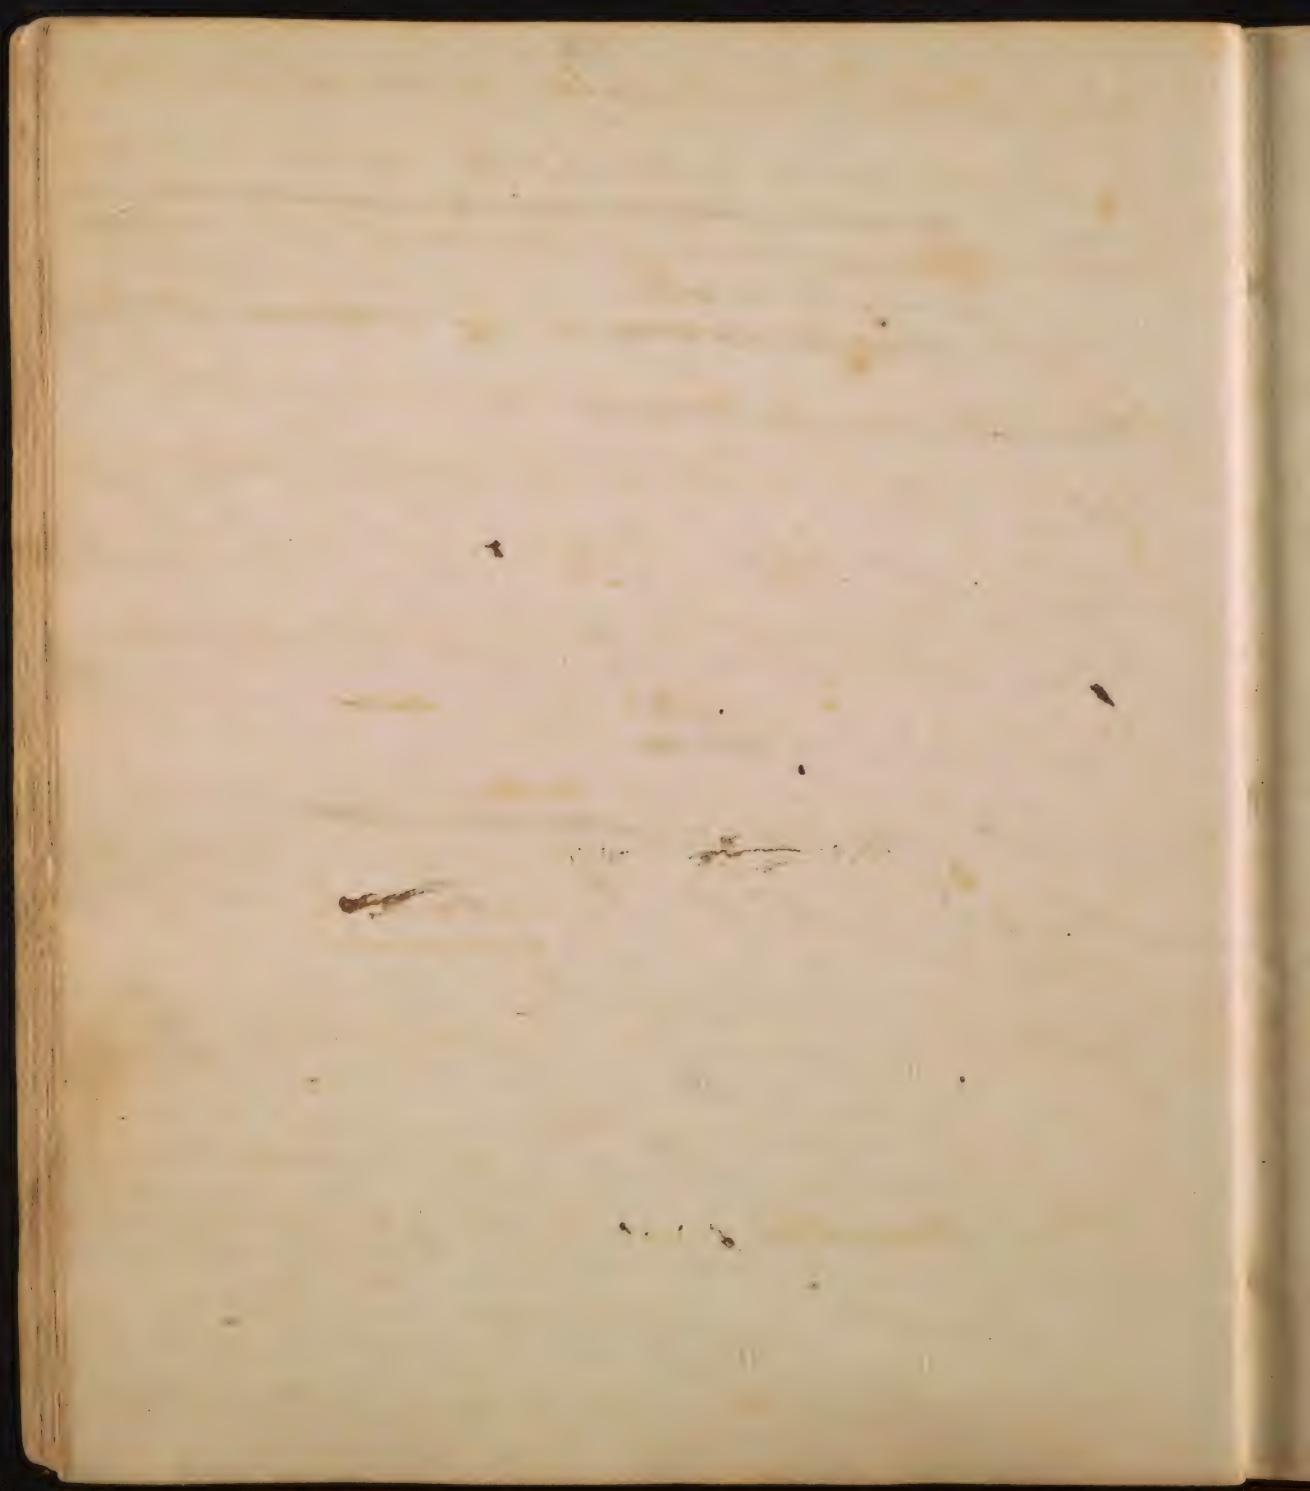

the powers which move the blood, and
by mention the advantages which are
derived to the system from this impor-
tant function in the animalconomy.

i. The blood after passing thro' the
pulmonary Arteries is received by the
pulmonary veins, by which it is
conveyed into the left auricle of the
heart - from whence it passes into the
left ventricle thro' which it passes
into the Aorta, which conveys it by
numerous branches into every part
of the body. The blood thus distributed
thru' the body, ~~is absorbed~~ whether
discharged ~~into~~ immediately into con-
tinuous & connected veins - or into

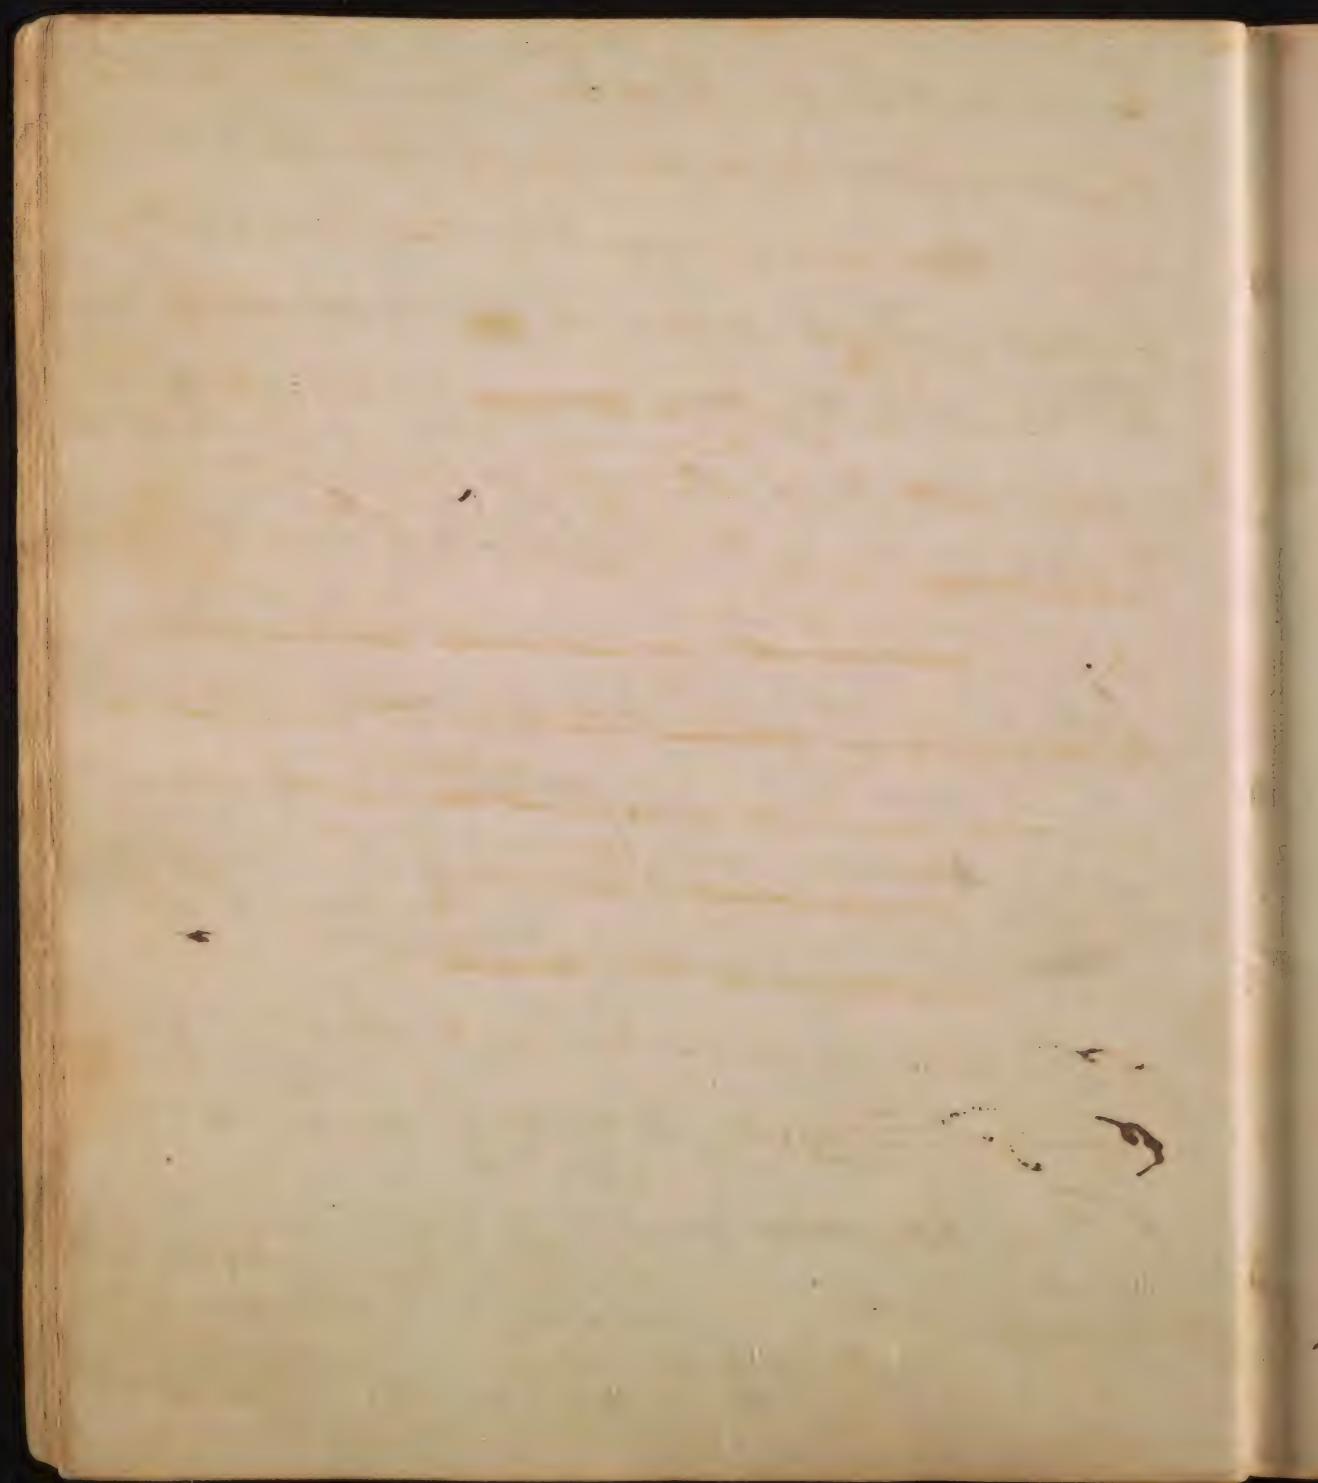

glands for the purpose of secretion - or into cavernous substances, as the corpora cavernosa of the penis - or into serous vessels, is all ~~carried into the~~ which meet in ~~the~~ ~~veins~~ ~~and~~ ~~thence~~ ~~the~~ ~~vena~~ ~~cava~~ this which it is poured into the right auricle of the heart, from whence it is emptied into the right ventricle of the heart ~~from~~ which I said for- ~~merly~~ ~~into the blood of the body~~ it was thrown into the lungs in respiration.

It is remarkable that the auracles & ventricles of the heart are perfectly synchronous - that is, both ~~contract~~ auricles contract, and both ventricles expand at the same time. The expansion of the heart is called its Diastole - its

219

contraction is systole. It is computed

it were, the part of an hand maid to
the veins, to pick up the fluids which
were too numerous - too weighty -
or too much diffused, ~~so~~ to be absorbed
or carried by them ~~back~~ to the heart.
from every part of the body,
after collecting this fluid the lymphatics
it with the Thyle
circulation pour into the left subclavian
from whence
Vein ~~carries it round to the heart~~
~~carries it to the heart~~
~~it is to the heart~~ After
having ~~performed its~~ ^{it} performed its journey home
by a different
route) ~~it~~ it enters ~~the~~ the heart
brought with its hindred blood into
~~the heart~~ the heart. —

~~2d~~ I come now now to mention some
peculiarities in the structure of the
heart & blood vessels which favours the
circulation of the blood in the manner

221

that has been described.]

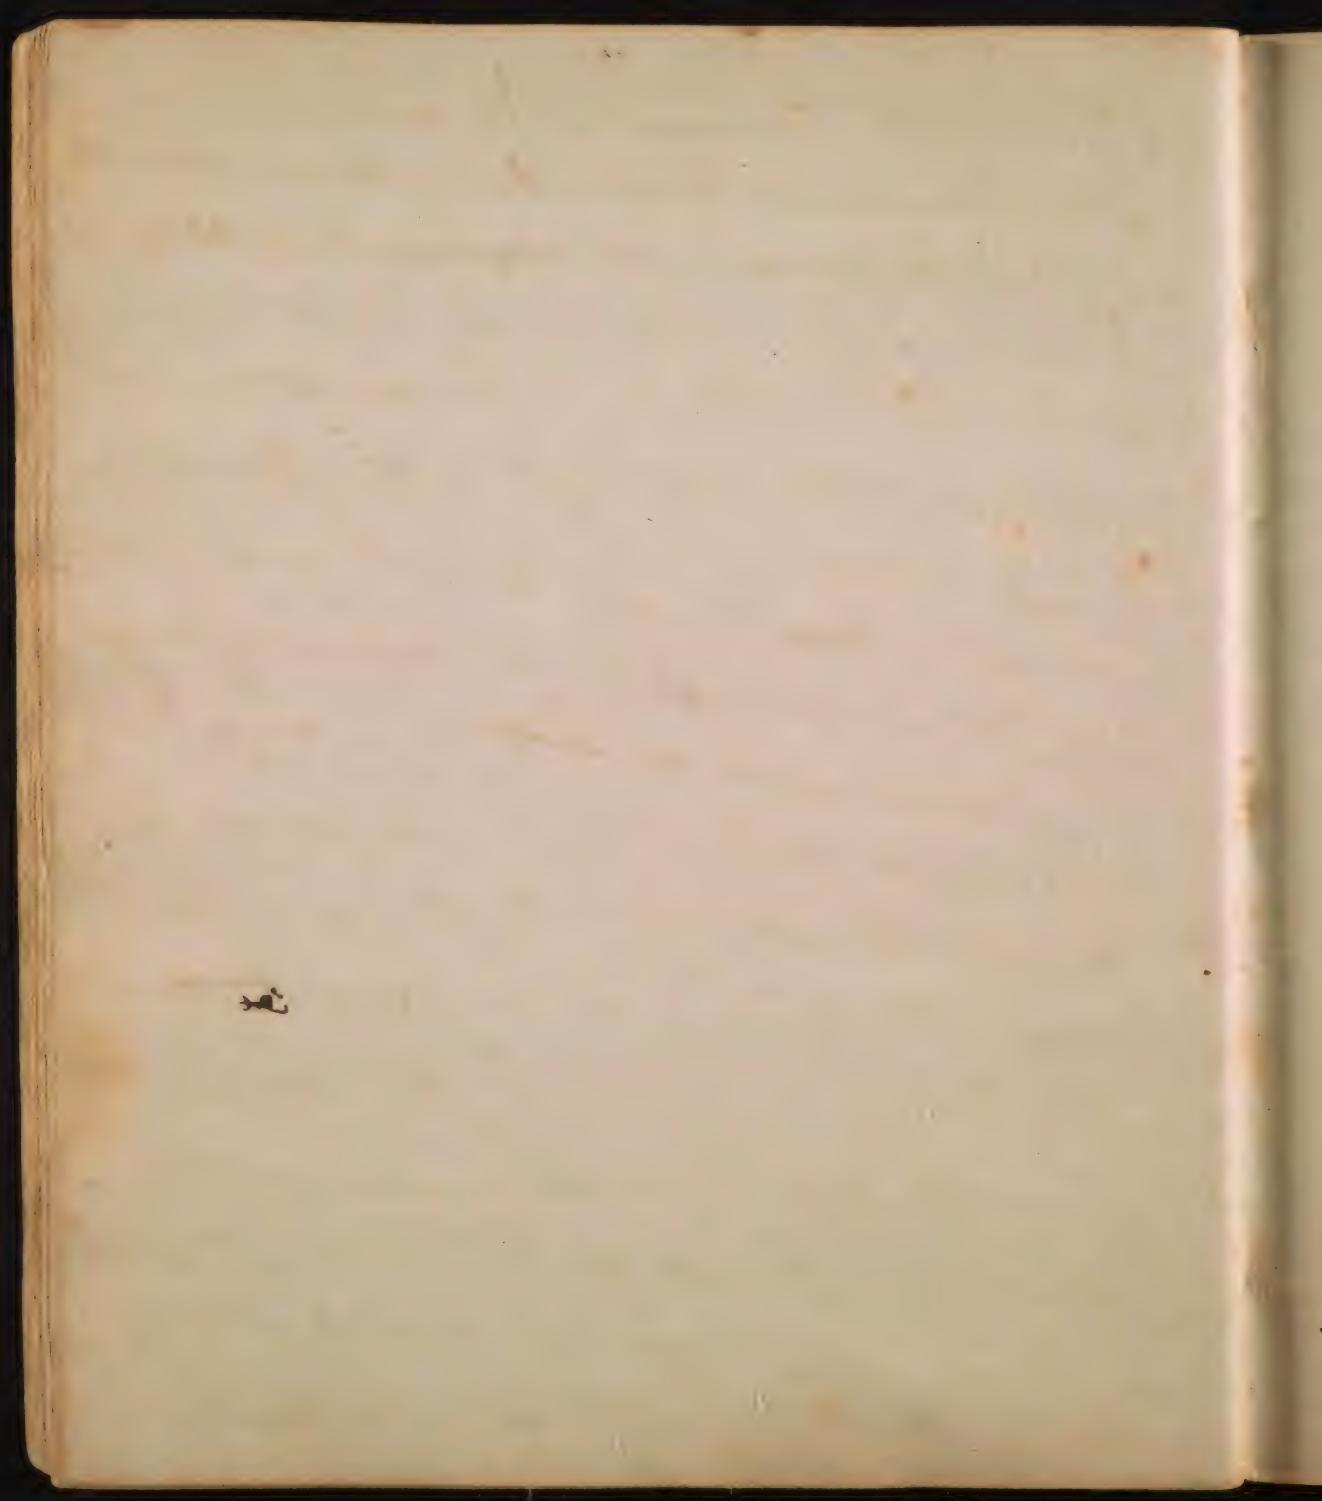

That the course of the blood ~~of~~ have described
in the ~~true~~ one, I infer from the following
facts & experiments.

1 From the effects of hemorrhages ^{w.} to
discharge blood alike from every part
of the body.

2 From the litigation - structure - and
functions of the ~~values~~ of the heart,
which admit of the blood's passage only
in one direction.

3 From the effects of ligatures which
cause the veins to swell below, &
the arteries above the place, where
they are applied.

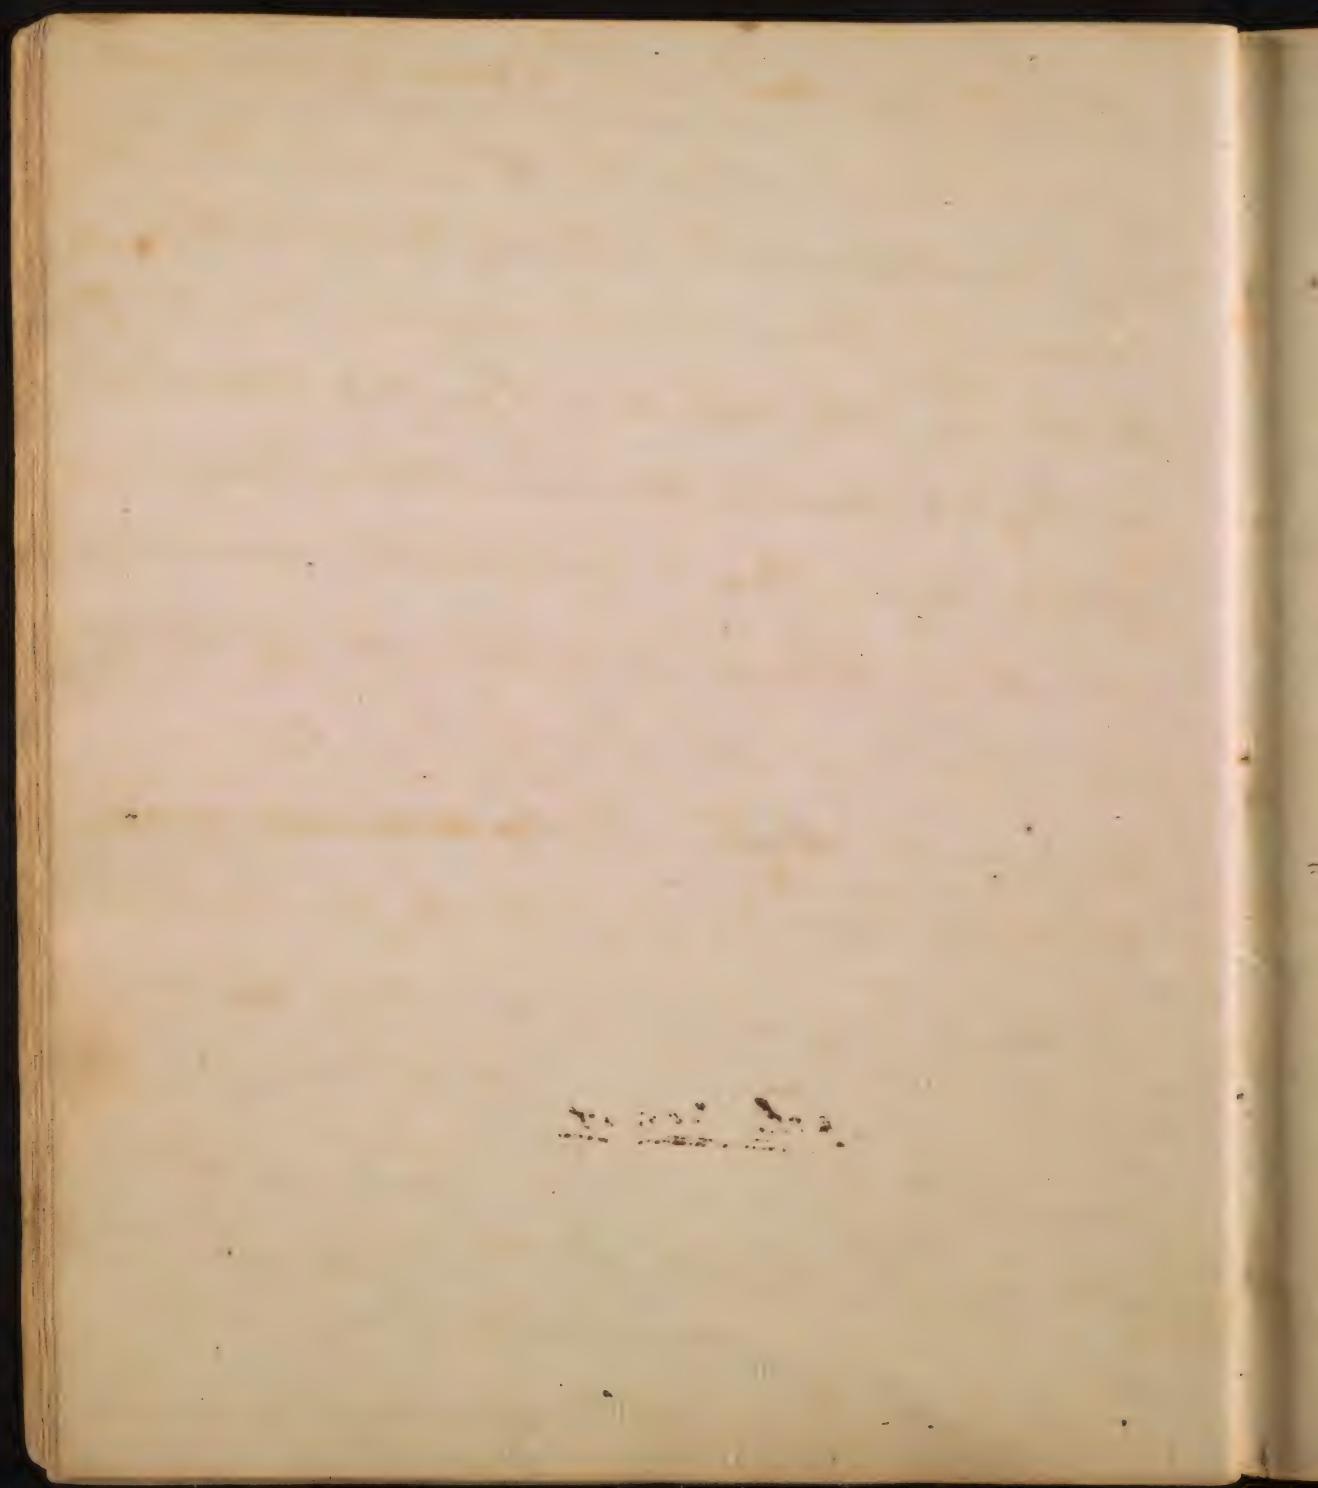

4 From the structure of the ~~values~~ of the
veins which likewise admit of the
blood's passage only in one direction.

5 From the Connexion & Continuation
of Arteries and Veins being demonstrated
by injections and microscopical Observa-
tions.

6 From the effects of tying a vein in
a living animal near the Cava, or
from tying one of the pulmonary Veins.
The part which is most remote from
the heart in either of these exp. ^{to} al-
ways swells, while that part w.^{h.}
is nearest the heart becomes flaccid.
If ~~an~~ a corresponding artery be tied
at the same time with the Veins, the
Veins become empty, nor do they
fill again till the ligature is removed
from the artery.

7 Lastly from the effects of transfusions

223

in which the blood ~~goes~~ ~~comes~~ is conveyed from the arteries of one animal into the veins of another ^{its} animal previously exhausted of blood, by which means the blood vessels of the exhausted animal are completely filled, and the circulation carried on thro' them with Vigor & regularity.

If I come now to mention some peculiarities in the structure, ~~of the heart, & in the prop-~~
~~erty & course of the~~
~~blood vessels~~ which favour the circulation of the blood in the manner that ~~has~~ been described.

1. The position ^{of the heart} in the Thorax where it is fenced by a bony cage on every side greatly favours its free & constant action.

V 5 It is the ^{strongest} ~~softest~~ muscle in the body in
all animals that have red blood. ~~the~~

It beats near 5,000 strokes in
an hour, and during the longest
life, knows no intervals of rest.
It moves the brain, & is again
moved by it. It ~~process~~ is chiefly
instrumental in conveying ~~the~~
that fluid to every part of the
body from which all the secretions
are obtained. Its presence & its action
are necessary to life, not only in
men, but in most other animals.
The prickly Hydra, and one or
two more animals are the only
exceptions to this observation. ~~the~~
~~the animal~~ The fire of the heart is generally in pro-
portion to

2 Its internal covering, called Pericardium, while its ~~favours~~ (from the vapor or water which it constantly contains) the more easy action of the heart, serves to defend it from the compression of effused fluids in the thorax. —

3 The ~~are~~ Cardiac nerves are accom-
panied by ^{a coronary} the artery which supplied the heart with blood. Now this artery seems to give a more exquisite degree of ~~excitability~~ ^{to the nerves of the heart} ~~excitability~~ ^{impellet} by keeping up ~~the~~ ^{their} tension.

4 The heart is evidently a hollow muscle, ~~and~~ possessed of all the properties of muscular fibres in every other part of the body. — ✓
~~From this position of the heart, it~~

the strength of an animal, too.

It possesses two auracles and ventricles in the human species, and in all animals that breath like him - in whale, and in amphibious animals it has two auracles & one ventricle. It has one ventricle and auracle in fish - ^{it} has but ~~one~~ a single cavity in ^{the} testacea & in ^{some} insects. ~~and~~ It identifies itself with a kind of arterial canal in worms & some insects & it disappears in the polyps & certain Zoophytes.

¶ It is remarkable that the right ventricle continues to beat longer by several strokes in a dying animal than the left.

¶ Its cavity is more irritable than its external surface. In frogs - turtles & several other animals it retains its power of being actuated a day or two after death. Its sensibility is ^{by} no means equal to its irritability. Even when ^{or inflamed} dissected, ^{that is felt is} the pain is dull. It is rather anxiety, than pain. See Harvey p 285. It has been found that the

or a spark of Electricity. It is certainly
the most irritable of muscle in the body: ^{etc} 

~~and~~ The following peculiarities with respect
to the Asteries deserve our notice, and
~~and~~

~~the want of sensibility in a healthy state~~ Its want of sensibility in a healthy state has been proved by Dr Harvey by many facts particularly by the history of a young nobleman who when a boy fractured his ribs on his left side. A suppuration ensued ^{wound only by a thin membrane} which produced an ^{opening in} exposure of the motion of the heart. Dr Harvey noted this

membrane & the heart with
it, but without giving the
least pain. ~~He~~ He conducted
his patient to King Charles
who ~~and the like~~ ~~had~~ did the same thing, and
with a similar issue to
the exp^t:

heart is more irritable in ~~old~~^{young animals} than
such as are full ~~of life~~: the influence of the will
~~is~~ ~~grown~~ ~~to~~ ~~be~~ hence it does not beat from
~~itself~~ ~~but~~ ~~it~~ ~~goes~~ ~~to~~ ~~it~~ ~~wards~~ from habit,
~~as~~ ~~was~~ ~~repeated~~ ~~by~~ Dr Berkley.

To all these facts I shall add one
more communicated to me by Dr
Alex^r Ramsay an eminent Brevetist
from Edin now ~~in~~ the District of Maine.
He says he has uniformly found the
left Ventricle of the heart larger ~~than~~ ⁱⁿ
all the Americans he had dissected than
in Europeans. }

226

to the middle ~~which is~~ ^{more obviously a} muscular coat
of the artery. This coat is of so compact
a nature, and so much more like
a membrane or ~~skin~~ an ex-
pansion of tendon, that Dr Haller &
Dr von Hwarter have both denied ~~it~~
that ^{it appears that} it ~~possesses~~ ^{possesses} ¹ irritability which
belongs to muscular fibre in other
parts of the body. This question shall
be controverted in its proper place. In
the mean while I shall only ~~add~~ add ¹ —
I shall ~~not~~ maintain an opinion
contrary to both those Physiologists, &
perhaps I may prove that Dr Haller
in spite of his objections to it, has in-
directly assented to it. —

✓ This simple elasticity is greater near the heart, where it is most necessary, than in the extremities. ~~extremities~~.

~~Mr. Hunter~~ Mr. Hunter supposes the
seat of Electric power is in the external,
& of the generator ^{power} in the internal
~~power~~ coat of the battery.

2^o all the Arteries have veins and blood vessels - their blood vessels are called Vasa Vasorum.

Arteries ~~do not~~ ^{but are joined with} form themselves. They are likened to 3 The Arteries possess great mechanical

elasticity. This is evident from the pressure which ~~has~~ a small piece of the artery of a dead animal makes upon the finger.

This simple elasticity is greater in a dead animal than in a living one - owing to the ~~force~~ ^{diastole} of the heart acting upon it.

~~distension~~ It is this distension of the arteries by means of each diastole of the heart that constitutes the Pulse.

It is common to all the arteries, but ~~is~~ imperceptible in the smaller ones, except in cases of inflammation.
